Device Synchronization

Data Import and Export · https://arba.app/userguide/device_sync/

You can use an unlimited number of iOS, Android and MacOS (M1, M2) devices to work with your data in ARBA Auto. To do this, you need to sign in to your account on these devices and ensure their connection to the Internet.

Synchronization of all devices is automatic. In some exceptional cases, for example, if the data update failed due to a bad connection, you can manually sync your device. Navigate to the "Backup" tab and tap the "Synchronization" button in the "Cloud Sync" section. You do not need to perform this action regularly. The whole process is automated.
